## Project

1. **■Data Filtering & Data Analysis Using Python .**  
Data filtering and analysis using Python involves manipulating and extracting meaningful information from a dataset.

2. **■deepfake detection and mitigation system**  
Developed a comprehensive system to detect and mitigate the effects of deepfake content. The system utilized advanced machine learning algorithms, including convolutional neural networks (CNNs) and recurrent neural networks (RNNs), to analyze and identify manipulated media with high accuracy. The system was integrated with both image and audio analysis tools to provide real-time detection capabilities. It also featured a mitigation module that flagged suspected content, provided authenticity scores, and generated alerts for further investigation. The solution was designed to be scalable, with applications in cybersecurity, media authentication, and legal forensics.
